# Water Utility Climate Alliance

43 million drinking water customers

## Mission Statement

*The Water Utility Climate Alliances provides leadership in assessing and adapting to the potential effects of climate change through collaborative action. We seek to enhance the usefulness of climate science for the adaptation community and improve water management decision-making in the face of climate uncertainty.*

## “Actionable Science”

*A Working Definition:*

Data, analysis, and forecasts that are sufficiently predictive, accepted and understandable to support decision-making, including capital investment decision-making.

# Chain of Models

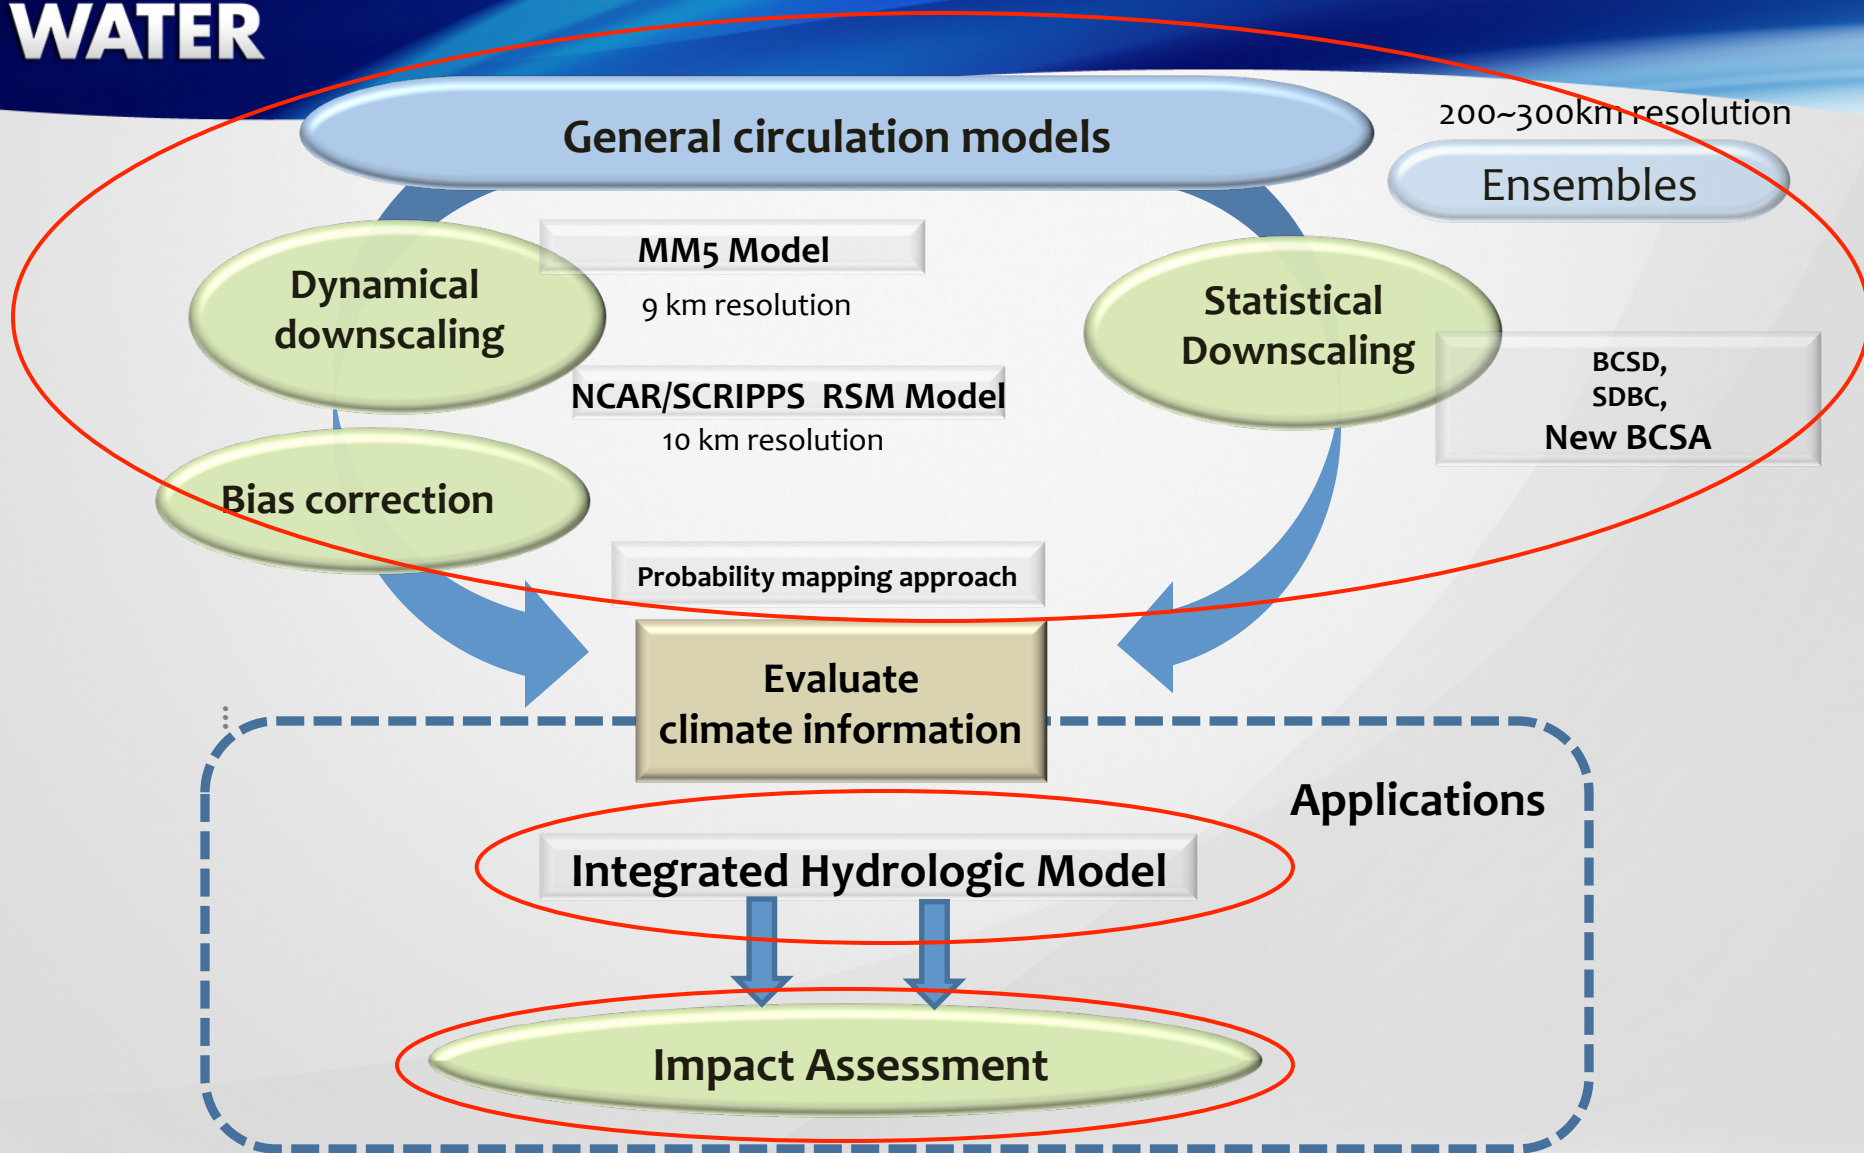

Slide adapted from Seattle Public Utilities

- Tampa Bay Water
- Denver Water
- New York City Department of Environmental Protection
- San Francisco Public Utilities Commission

# Climate Change Assessment Framework

# BCSD GCMs and NST GCMs Variogram Comparisons

## Comparison of annual observed, modeled and bias-corrected rainfall timeseries

# Projected Changes for Denver's Watershed (Front Range Study, 2012)

## ○ ***Simple Assessment***

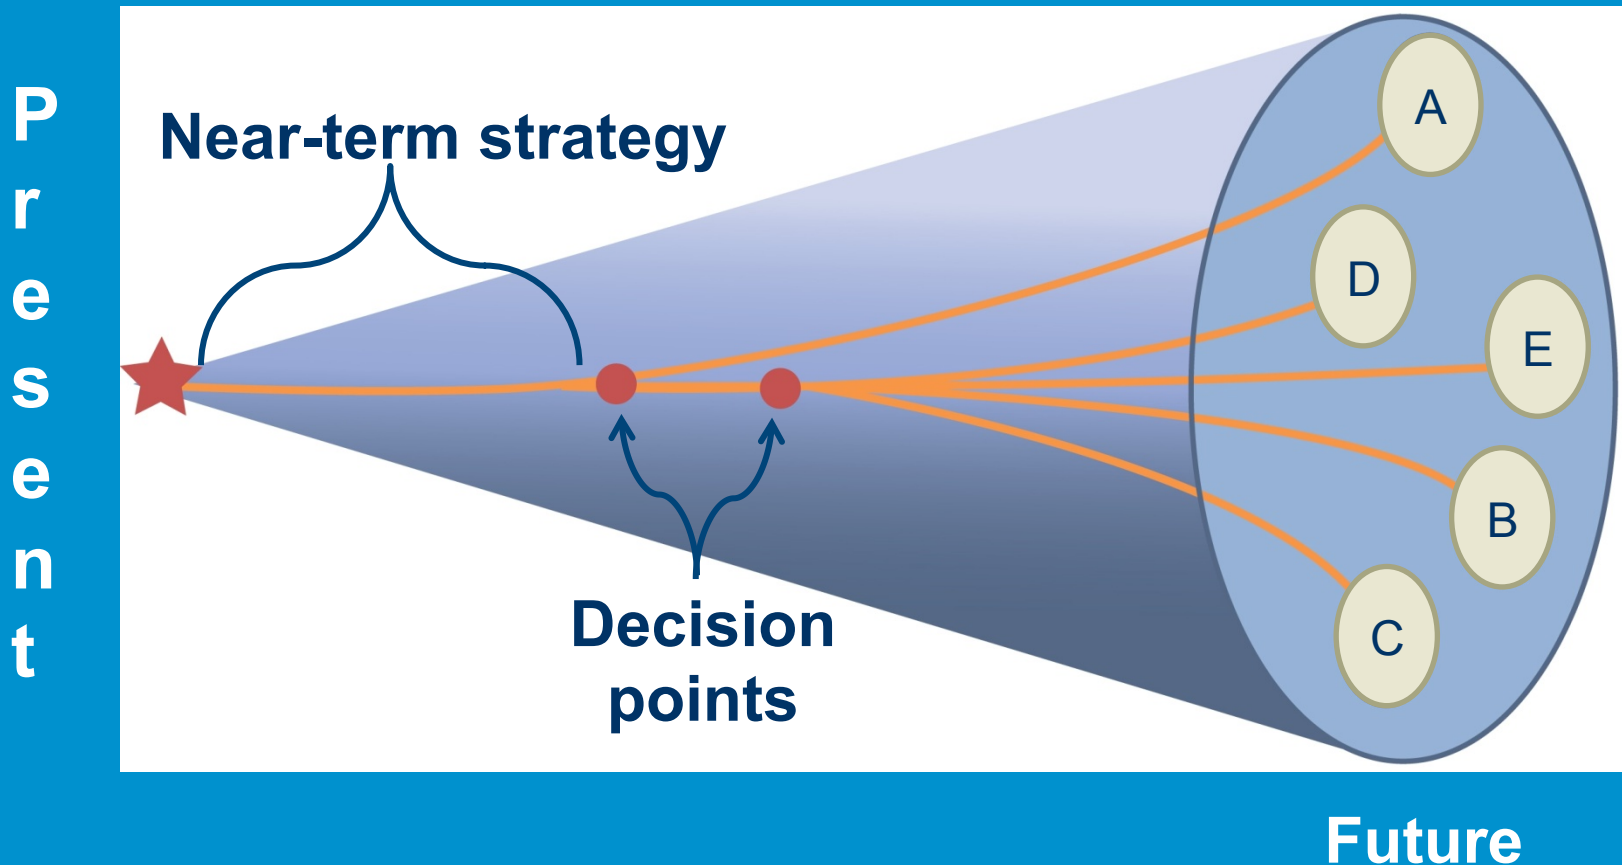

- Constant Temperature or Precipitation offsets
  - Increase of 1°C
  - **Increase of 5°F**
  - Increase of 7.5%
  - Decrease of 3%

## ○ ***Sophisticated Approach***

- Scenarios for 2040 and 2070
  - warm and wet
  - warm and dry
  - median
  - very warm and wet
  - very warm and dry

**30 Sets of  
NEW  
Streamflow  
for 18 sites**

## The Cone of Uncertainty

# NYCDEP: Climate Change Scenarios

## Change Factor Method Applied for 8 GCM/Emission Scenarios

GCM - Emission Scenario	Current Conditions Scenario	65 Year into Future Scenario	100 Year into Future Scenario
ECHAM-A1B	1981-2000	2046-2065	2081-2100
ECHAM-A2	“	“	“
ECHAM-B1	“	“	“
GISS-A1B	1981-2000	2046-2065	2081-2100
GISS-A2	“	“	“
GISS-B1	“	“	“
NCAR-A1B	1980-1999	2046-2065	2080-2099
NCAR-A2	“	“	“

- GCM/Emission Scenario data obtained from IPCC AR4 (2007)
- For each GCM/Emission Scenario, precipitation and air temperature are compared in control vs. future periods to derive monthly change factors.

# NYCDEP:

## Application of Change Factor Method - Precipitation

Average GCM-Projected Precipitation by Month for Control and Future Periods

	<i>J</i>	<i>F</i>	<i>M</i>	<i>A</i>	<i>M</i>	<i>J</i>	<i>J</i>	<i>A</i>	<i>S</i>	<i>O</i>	<i>N</i>	<i>D</i>

20	MRI-CGCM2.3.2	1,2,3,4,5	1,2,3,4,5	1,2,3,4,5	1,2,3,4,5	1,2,3,4,5	1,2,3,4,5

# What We Need from the Climate Modeling Community

- Access to updated repository of downscaled GCM output for our region for variables of interest (daily precipitation, max/min/average air temperature, wind speed, solar radiation, relative humidity).
- Guidance for GCM/RCM selection. Which GCMs and/or downscaling methods are most appropriate for our region/application/parameters; and why?
- Better tools for downscaling data.
- Capturing effects of climate change on local convective storms is very important (These storms have a large effect on turbidity).

- Task 5: ... decision support context (M, RDM)
- Task 6: Produce report, stakeholder workshop

**Team: David Yates** (Project Manager) and **Caspar Amman**, NCAR;  
**Bridget Thrasher**, Climate Central; **David Behar** and **Alexis Dufour**, SFPUC.

- Commonalities

- Partnerships between water managers and climate scientists
  - **CO-PRODUCTION OF ASSESSMENT**
- Iterative use of climate information
- Downscaling (NYCDEP's a little different)
- Downstream modeling tools process climate information

- Differences

- Partnerships: Each one a new invention of different nature
- Different GCM and downscaling tools selected
- Method of selection: availability, cost, opportunity, evaluation, experimentation
- Complexity, difficulty
- Reproducibility? “Best Practice?”

# Sea Level Rise: Today's Adaptation Challenge

# Backflow Prevention for twenty-nine bayside discharges/collection points

## Current status:

- Today: 16 of 29 overflow weirs have backflow during the seasonal high tides.
- Total Project Costs: \$20-40 million over 5 years.

# Perth: Storage inflows (1911-2003)

Note: A year is taken as May to April ("2004": May 2004 to Apr 2005 is an estimate only)

# Uncertainty: Natural variability/ Emissions scenario/Model uncertainty

- Emissions uncertainty
- Internal variability
- Model uncertainty

*From Hawkins & Sutton 2009  
(BAMS) and 2010 (Climate  
Dynamics)*

# Priorities

---

- T, P, Wind, Solar: What we care about most
- Subdaily saved data: Can we make it available?
- Higher resolution GCM runs: Next best thing?
- Focus on central latitude precipitation: Continued improvement to Tropical Pacific, etc.
- Improved characterization of uncertainty
- “Community” archived datasets: Accessible multi-model ensembles
- Dynamical, other downscaling experiments that respond to our scale needs
- CORDEX-inspired experiments

- 12 Projects, including:
  - Piloting Utility Modeling Applications (PUMA): Assessment and climate services experiments in five water utilities
  - Decision Support Planning Methods White Paper: Case Studies of DSPMs in action
  - Engage in National Climate Assessment
  - Participate in CESM Societal Dimensions Work Group focus area on water resources
  - Discern federal agency adaptation activities (stagnant – the WUCA work plan, not the activities)
  - Write short white papers on urgent subjects: First paper on Climate Services (Behar, Fleming, et al)

# Approaches

---

1. Improving understanding of how climate system works and how it is represented in models
2. Improving archiving of data from models that currently exist to enhance accessibility and downstream experiments

# Objectives for improved science

---

1. Improve model agreement on change in key parameters.
2. Narrow range of model output
3. Match model resolution with scales of water utility hydrologic and systems models (and other users' tools)
4. Improved projections within planning horizons of decisionmakers, i.e. several decades

- **GCM Options**

1. Development and enhancement of global climate model ensembles
2. Improved use of observations to constrain climate model projections
3. Improved modeling of the Tropical Pacific
4. Improved decadal prediction

- **Downscaling Options**

1. Development of regional ensembles
2. Development of regional climate model components
3. Development of statistical downscaling techniques for probabilistic downscaling, extremes, and daily data
