

Can additive manufacturing save energy and resources? Cutting through the hype.

Eric Masanet, Ph.D.

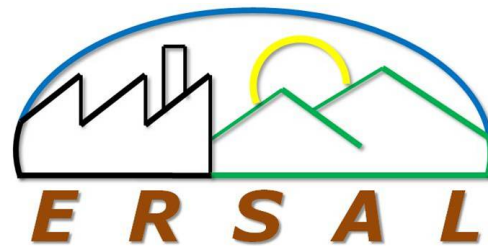

Associate Professor

McCormick School of Engineering and Applied Science

Director, Energy and Resource Systems Analysis Laboratory (ERSAL)

Guest Faculty Researcher, Argonne National Laboratory

eric.masanet@northwestern.edu

Who Needs The Paris Climate Accords When You Have 3D Printing?

Forbes

Richard A. D'Aveni Contributor ⓘ

I cover the strategic management of business and government

<https://www.forbes.com/sites/richarddaveni/2017/08/02/who-needs-the-paris-climate-accords-when-you-have-3d-printing/#1284e4db8645>

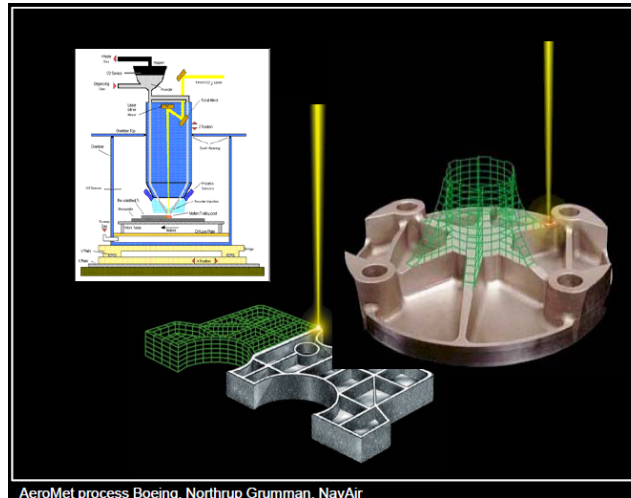

<https://3dprintingindustry.com/news/oecd-say-3d-printing-will-replace-traditional-machining-within-10-years-120509/>

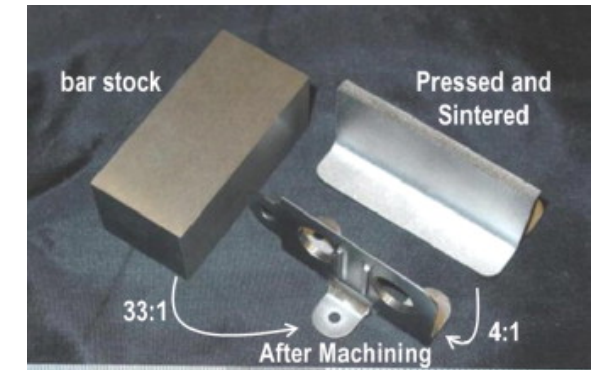

There are many potential benefits to AM ...

Potential benefits

- 3-D graphical models, parts built in layers
- No tools, dies, or forms
- Near final shape
- Reduced delivery times
- Mechanical properties equivalent to wrought
- Reduced material use
- Reduced inventory
- Significant cost and energy savings

Buy-to-fly ratio examples

Chen et al. (2012)

Airbus example (120 brackets)

Additive Manufacturing

0.38 kg finished part from 0.7 kg raw material

Conventional Machining

1.09 kg finished part from 9.7 kg raw material

... but also many important barriers and limitations!

Important considerations

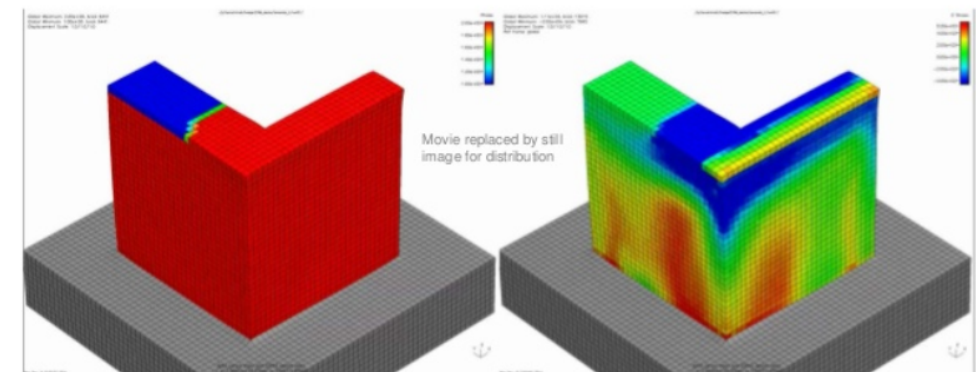

- Residual stresses (e.g., SLM)
- Surface roughness
- Fatigue life, loading
- Dimensional accuracy
- Throughput rates
- Availability
- Cost!

➤ Benefits and barriers are highly application specific!!!

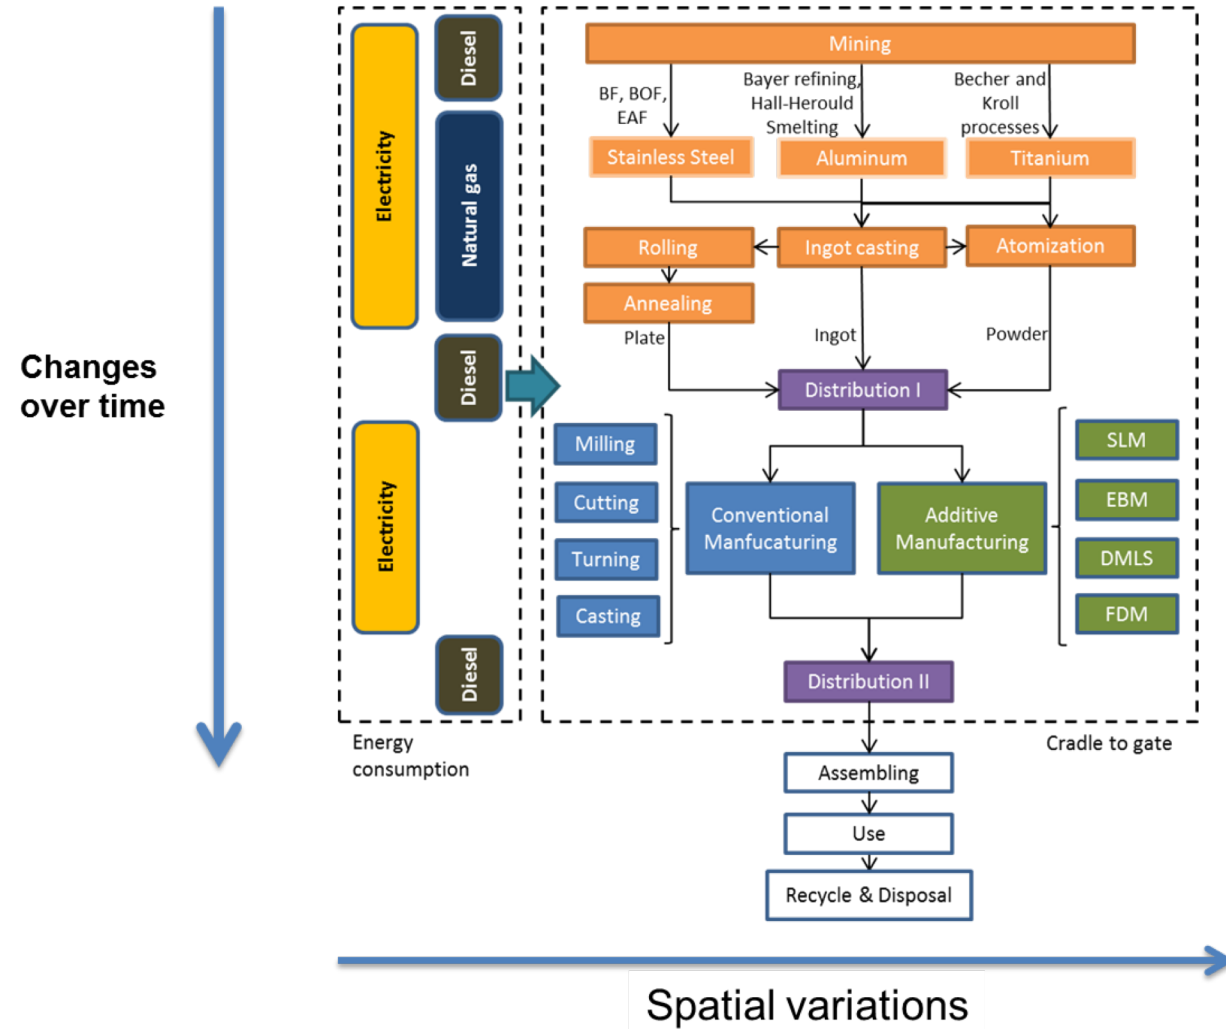

<https://3d-printing-engineering.com/easyblog/entry/additive-manufacturing-technologies>

Diablo (LLNL) simulation of residual stress during build

Hodge, N.E., Ferencz, R.M., Vignes, R.M., 2016. Experimental Comparison of Residual Stresses for a Thermomechanical Model for the Simulation of Selective Laser Melting. Additive Manufacturing DOI: <http://dx.doi.org/10.1016/j.addma.2016.05.011>.

So how do we assess AM's potential? A dynamic, integrated systems modeling approach is required!

Multi-stakeholder performance evaluation criteria

- Life-cycle flows:
 - Resource use
 - Primary energy use
 - Air pollutant emissions
- Engineering functionality
- Production economics
 - Lead time
 - Inventory
 - Capital and O&M costs
- Technology readiness

Methods/tools integrated

- Life-cycle assessment
- Energy systems modeling
- Production economics
- Engineering process modeling
- Materials property assessment

U.S. Aircraft Fleet Case Study (2015-2025)

Technical analysis: Which parts are AM compatible?

Table 2: Aircraft component system attribute ratings

| Component systems | Component category | Mass fraction | Load rating | Shape complexity rating | Geometric volume rating | Feasibility evaluation score* |
|-------------------|--------------------|---------------|-------------|-------------------------|-------------------------|-------------------------------|
| Wing systems | | 0.24 | | | | |
| | Structural | 0.95 | High | Medium | High | 4 |
| | Auxiliary | 0.05 | High | Low | Low | 5 |

Technical analysis: How much mass can be replaced, and by when?

Replaceable mass by metal alloy, component system, and component category.

| Component system | Category | Replaceable mass in average aircraft (kg) ^a | | | |
|---------------------------|--------------|--|------------------|-----------------|----------------|
| | | Al alloy | Ti alloy | Ni alloy | Steel |
| Body systems | Auxiliary | 80–200 | | | |
| Furnishings and equipment | Structural | 70–130 | | | |
| | Functional | 1450–1930 | | | |
| Engine | Functional | | 680–1350 | 940–1880 | 100–190 |
| | Auxiliary | | 50–90 | 50–90 | 50–90 |
| Propulsion systems | Functional | | 330–810 | | |
| Nacelle systems | Auxiliary | | 20–40 | | |
| | Total | 1590–2260 | 1070–2290 | 980–1960 | 140–280 |

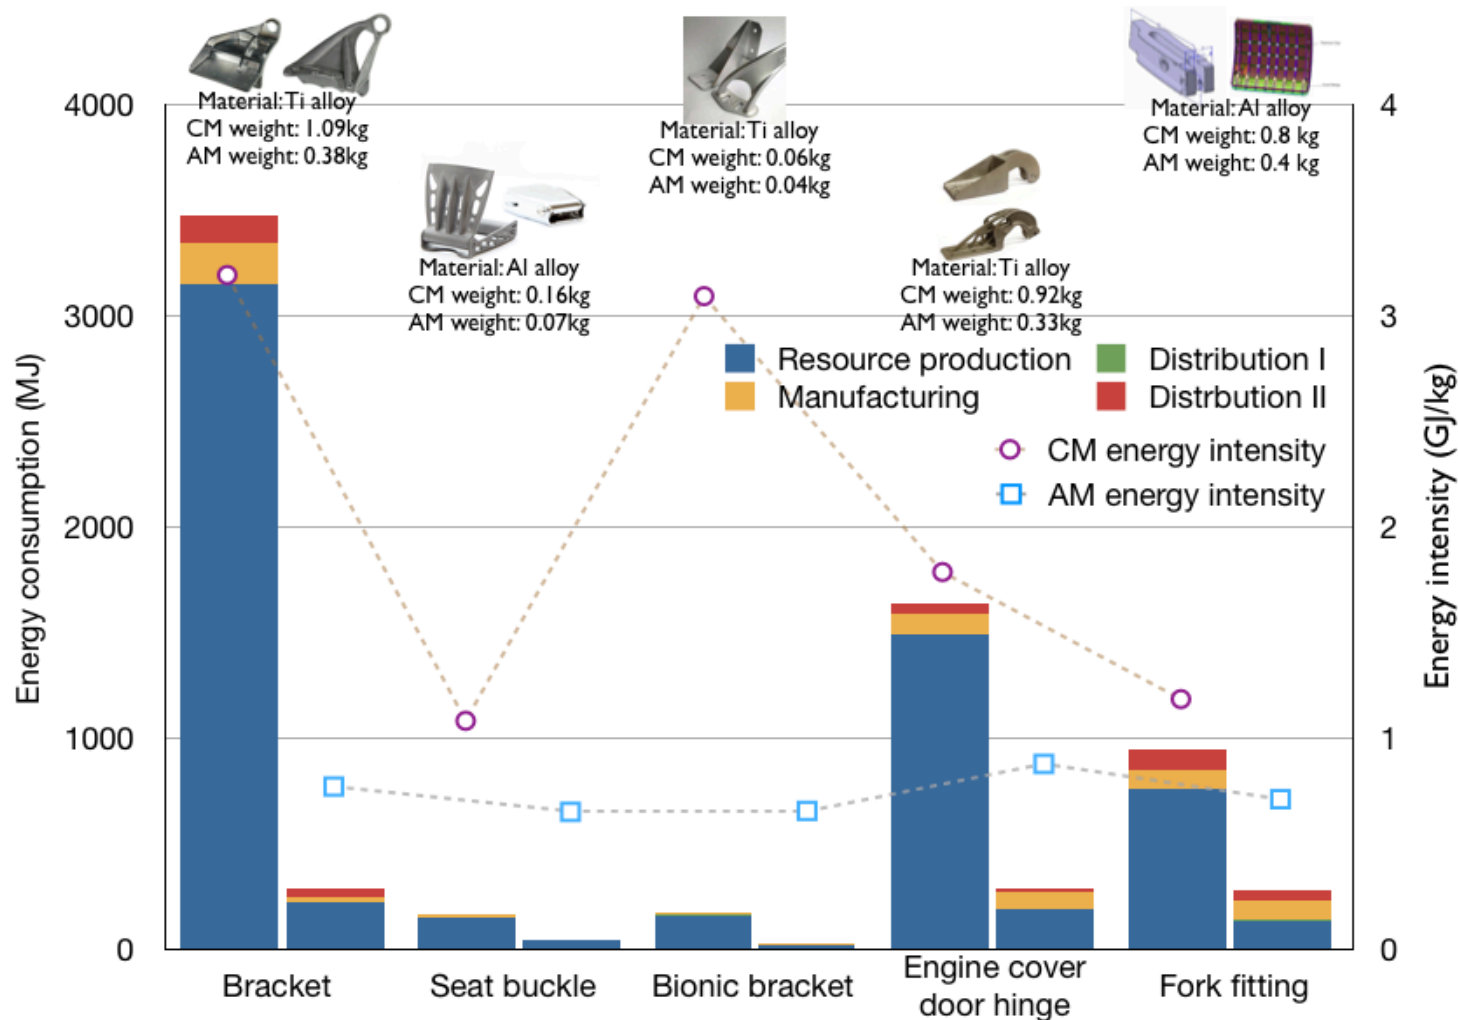

^a Based on an average aircraft empty operating mass of 40,622 kg ([Airliners.net, 2013](#); [Bureau of Transportation Statistics \(BTS\), 2013](#)).

Temporal availability assumptions.

| Component system | Component category | Availability |
|-----------------------------------|--------------------|-------------------------------------|
| Body systems | Auxiliary | 10 years (2024) |
| Furnishings and equipment systems | Structural | 5-10 years ^a (2019–2024) |
| Furnishings and equipment systems | Functional | 10 years (2024) |
| Engine | Functional | 20 years (2034) |
| Engine | Auxiliary | 10 years (2024) |
| Propulsion systems | Functional | 20 years (2034) |
| Nacelle systems | Auxiliary | 5 years (2019) |

^a 5 years for galley and lavatory, 10 years for floor panel, fasteners and other.

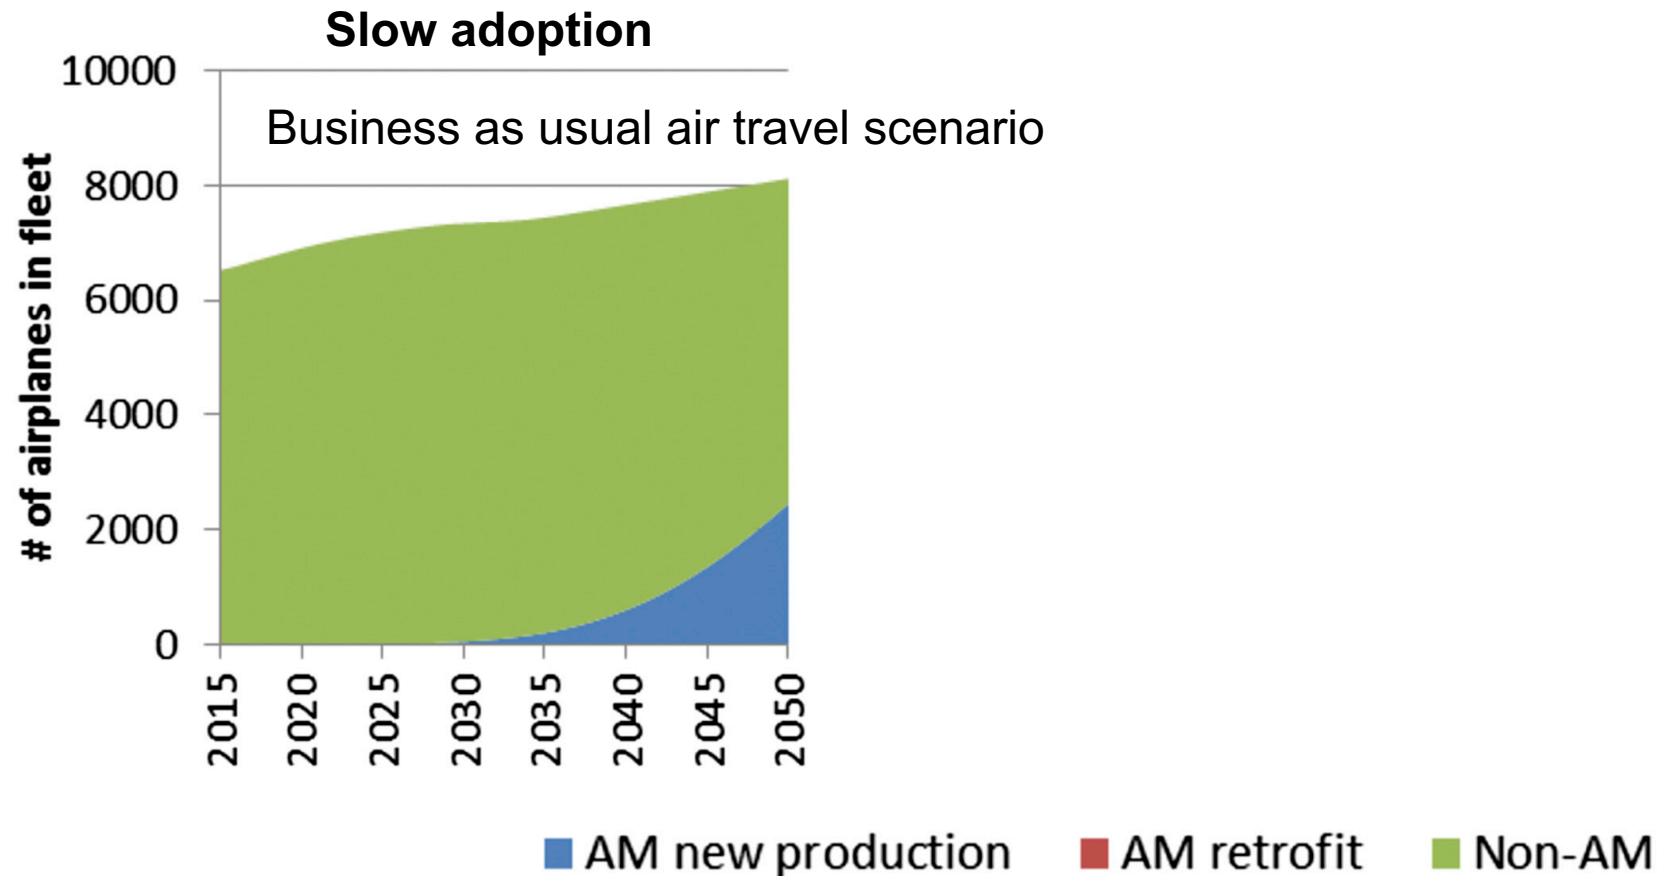

“Cradle to gate” AM energy savings: one size does not fit all!

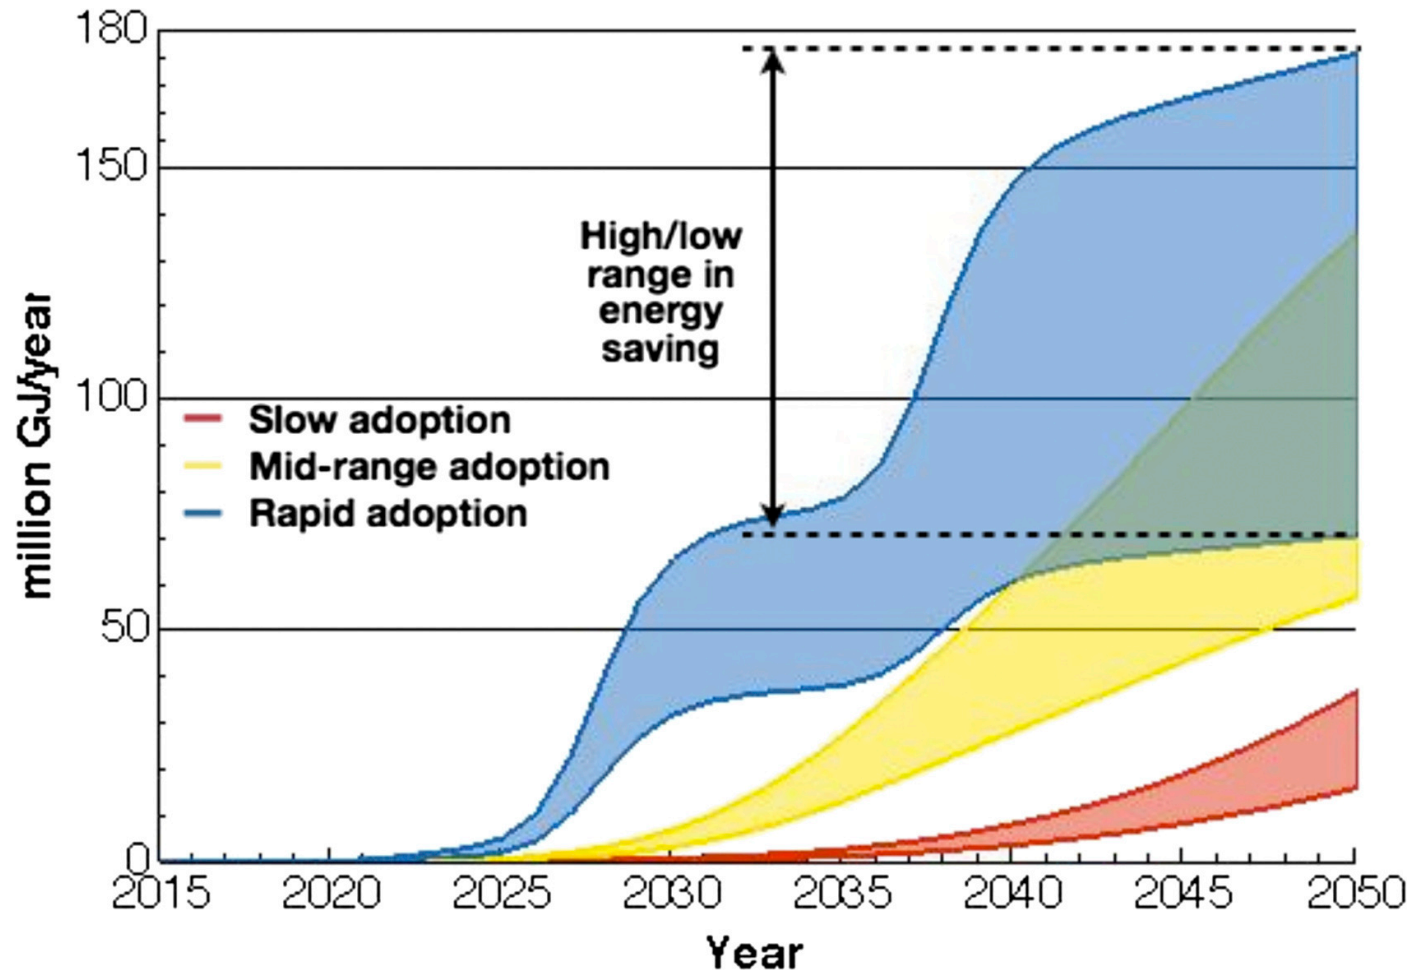

When does AM beat conventional processes?

- Small production quantities
- High part complexities
- Expensive materials with significant scrap
- Low part mass (i.e., small total volume)
- Minimal load/fatigue (in the near term)
- **Significant redesign potential**

Aircraft AM adoption scenarios: How can we accelerate deployment?

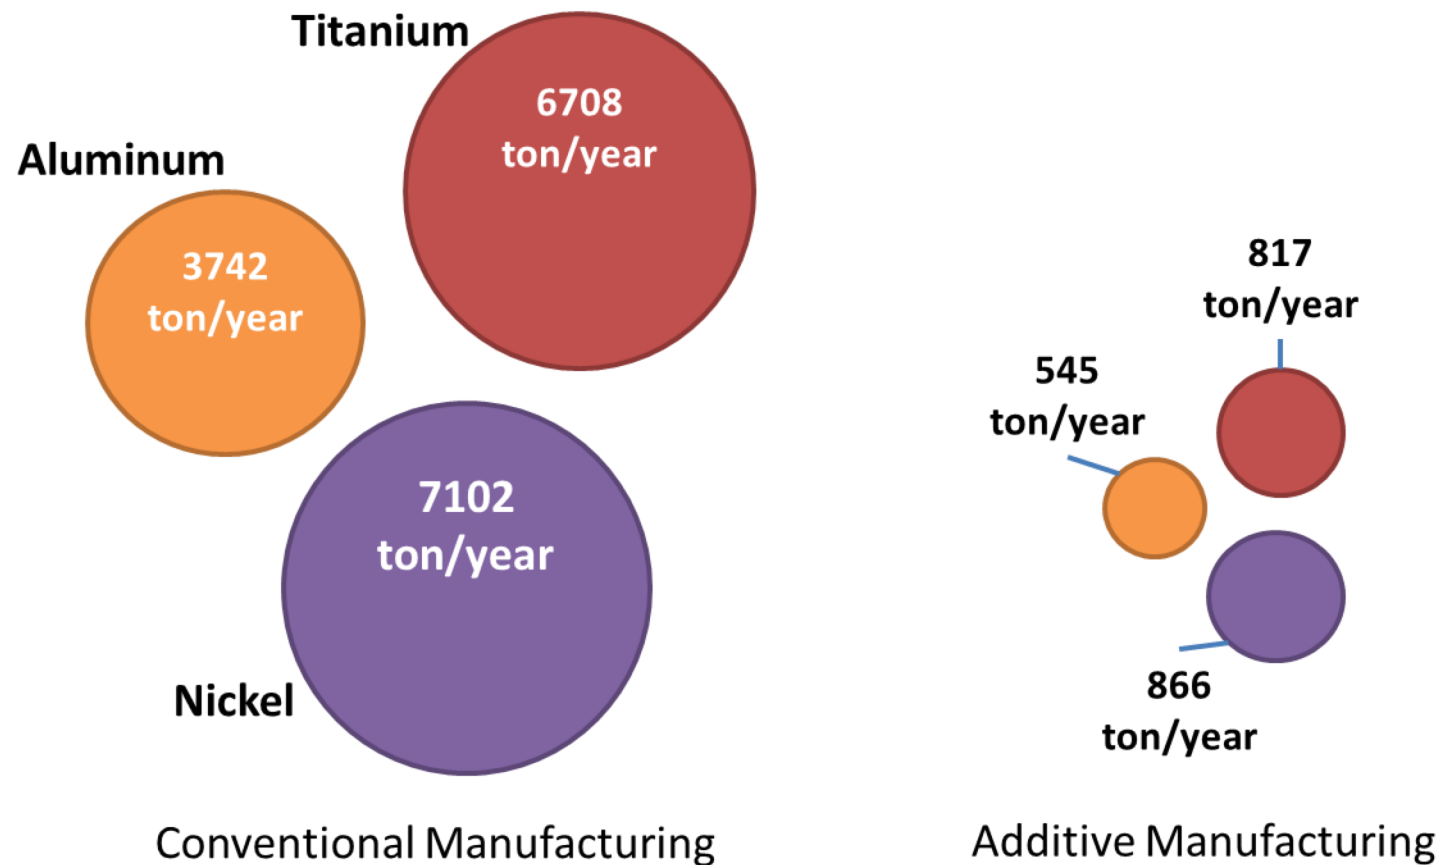

Accelerating fuel saving benefits: the role of science policy

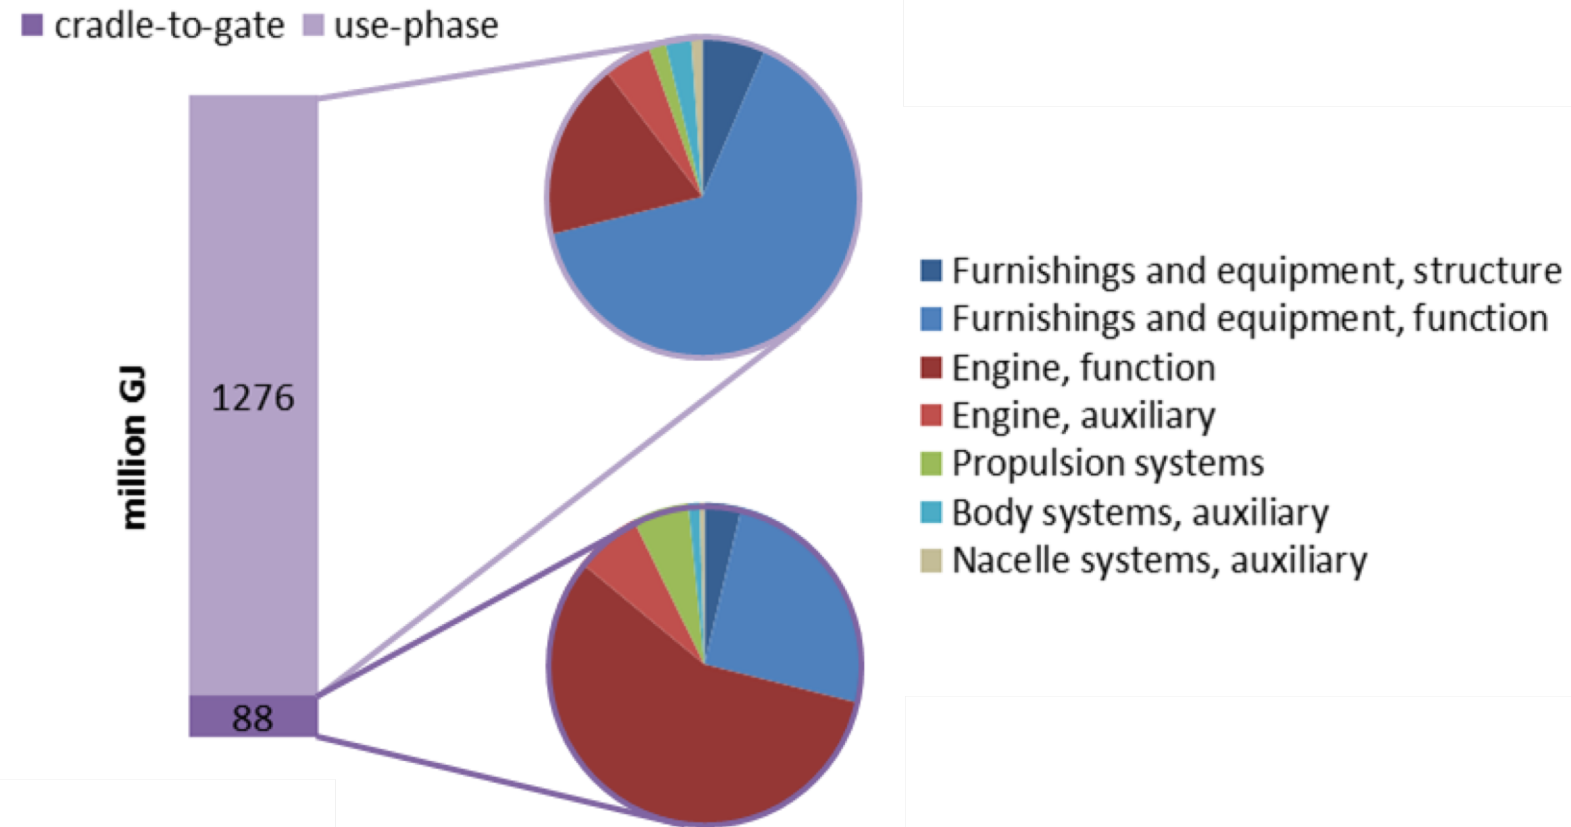

Policy and R&D levers for accelerated adoption:

- Improved surface finish (basic research)
- Reduced residual stresses (basic research)
- Pilots and demonstrations
- Technology transfer programs
- Cost and externality incentives for AM adoption

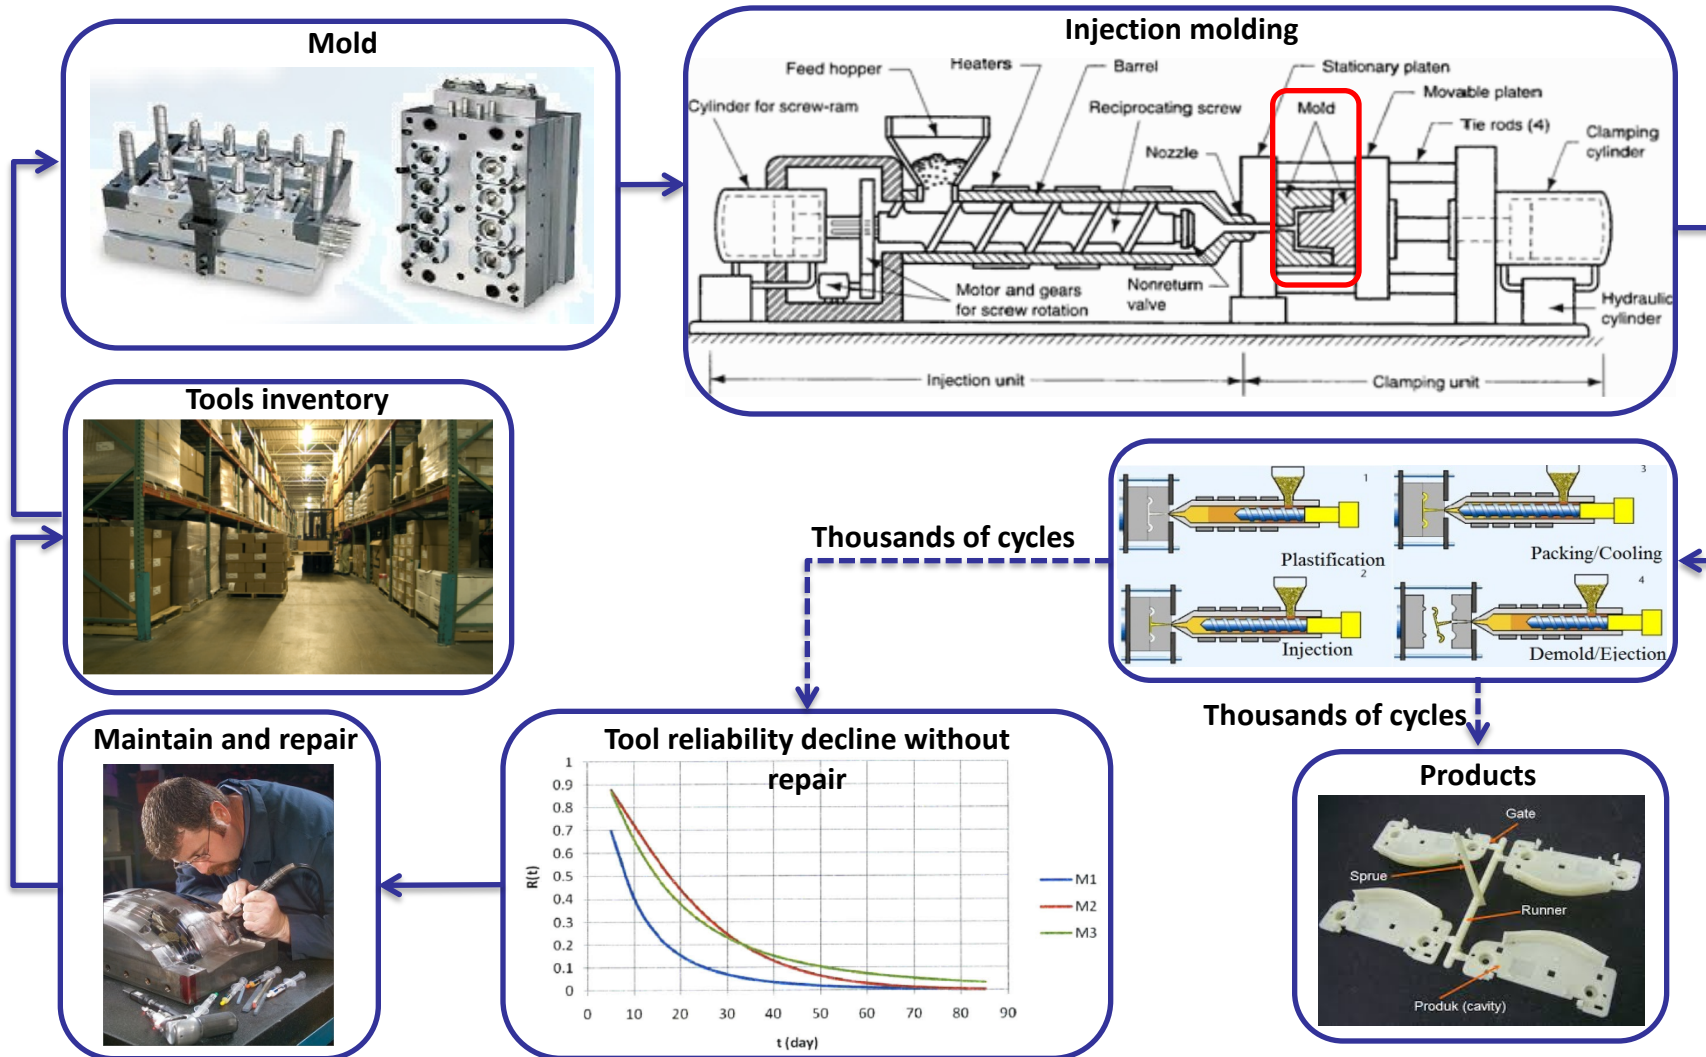

In 2050, AM delivers significant resource savings in feasible applications

However, it is improved design functionality that delivers the greatest energy savings!

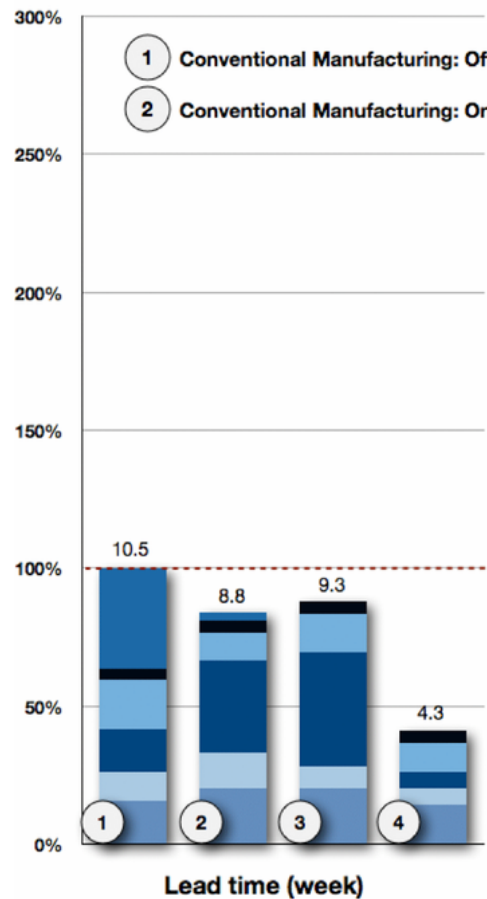

What about cost? Injection molding example

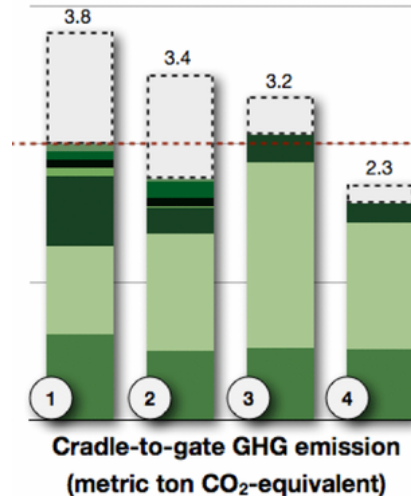

Is there a business productivity case for AM adoption?

 Material Production

Enabling policies and investments are critical to close this gap

Conclusions

- AM can deliver savings, but savings are highly case specific
- To realize its potential, technical barriers must be overcome
 - Surface roughness, residual stresses, process throughput, technology cost, etc.
- Consideration of systems effects is critical for the AM value proposition
- Deep techno-economic and engineering analysis is required
 - Broad brush generalizations must be avoided!

Insights for integrated assessment modeling

- AM is one of many emerging industrial technologies that are not well represented in IAMs
- To fill these knowledge gaps, priority research areas include:
 - Greater linkages between lab- and pilot-scale technology research and prospective techno-economic systems modeling research
 - Development and codification of prospective modeling approaches
 - Improved training in prospective techno-economic assessment tools and methods

THANK YOU!
