# 2017 Drought Developed During the Wettest 3-Month Season and the Growing Season

(a) May-July Contribution to Annual Precipitation

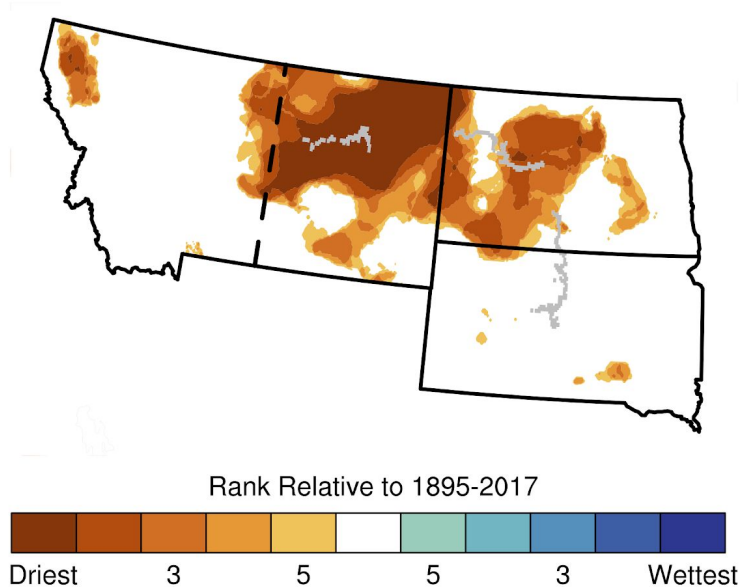

(b) Regional Monthly Contribution to Annual Precipitation

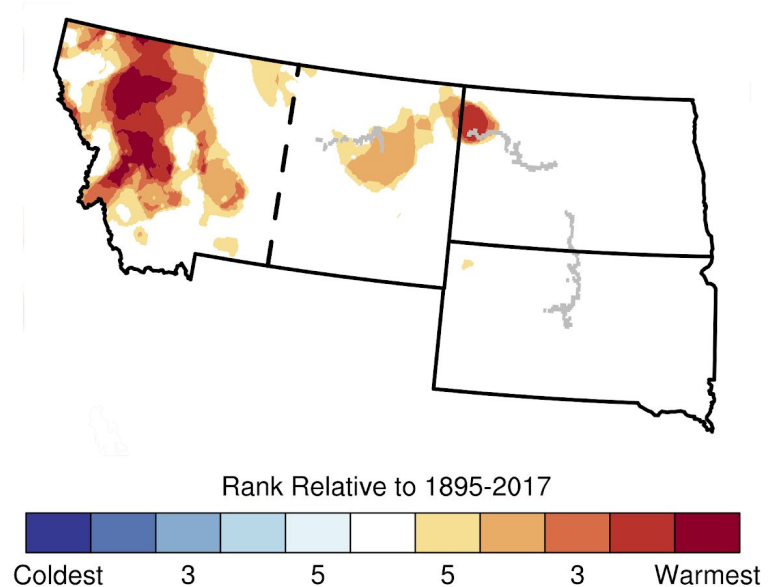

# Driest May-July Since At Least 1895 Caused the 2017 Drought

(a) May-July 2017 Precipitation Rank

(b) May-July 2017 Average Temperature Rank

# Questions

- Was the low May-July 2017 seasonal precipitation predictable in advance of the season?
- Could the low May-July 2017 seasonal precipitation have been forecast at any lead time?
- What are the sources of May-July precipitation predictability?

# Tools: Observed Estimates

- Precipitation
  - NCEI GHCN gridded 5km precipitation version 1 (Vose et al. 2014)
  - Daily precipitation from NCEI GHCN-daily version 3 (Menne et al. 2012)
- Sea Surface Temperatures
  - Based on the Hurrell et al. (2008) analysis, which combines HadISST with NOAA OI on a 1°x1° grid. Also forces the AMIP simulations

# GHCN Stations Considered

Elevation (Feet)

| Station ID  | Station          | Latitude (North) | Longitude (West) |
|-------------|------------------|------------------|------------------|
| USC00241088 | Bredette         | 48.15            | 105.30           |
| USC00241231 | Brusett 3N       | 47.46            | 107.31           |
| USC00243013 | Flatwillow 4 ENE | 47.10            | 108.37           |
| USC00243581 | Glendive         | 47.10            | 104.72           |
| USC00243727 | Grass Range      | 47.02            | 108.80           |
| USC00244358 | Hysham           | 46.29            | 107.22           |
| USC00245303 | Mackenzie        | 46.14            | 104.72           |
| USC00245596 | Melstone         | 46.60            | 107.90           |
| USC00245754 | Mizpah 4 NNW     | 46.28            | 105.29           |
| USC00246601 | Plevna           | 46.42            | 104.52           |
| USC00247214 | Roundup          | 46.44            | 108.54           |
| USC00247560 | Sidney           | 47.72            | 104.13           |
| USC00248165 | Terry            | 46.79            | 105.30           |
| USC00248957 | Wilbaux 2E       | 46.99            | 104.16           |
| USW00024037 | Miles City       | 46.43            | 105.88           |
| USW00094008 | Glasgow Intl AP  | 48.21            | 106.62           |

# Tools: North American Multi-Model Ensemble

- Include models that were operational in 2017 whose hindcast and forecasts of precipitation span 1982-2017
- Focus on April-initialized forecasts
- Anomalies and terciles relative to own model
- Data source:

<https://iridl.ldeo.columbia.edu/SOURCES/.Models/.NMME/>

| Model                | Members                      | Reference   |
|----------------------|------------------------------|---|
| EMC:<br>CFSv2        | 24                           | Saha et al. (2014)                                |
| Env. Canada:<br>CMC2 | 10                           | Merryfield et al. (2013)                          |

| RSMAS:<br>CCSM4      | 10                           | No ref, so use model ref:<br>Gent et al. (2011)   |

# Tools: AMIP Simulations

- 60-member ensemble of atmospheric model simulations forced by prescribed boundary conditions for 1982-2017
  - 30 members from the CAM5 model
  - 30 members from the ECHAM5 model
- Models interpolated to the CAM5 grid
- Anomalies and terciles relative to own model

## Tools: GEFS Forecasts

“The ESRL/PSD 2nd-generation Reforecast Project has produced a dataset of historical weather forecasts generated with a fixed numerical model, using the 2012 version of NCEP's Global Ensemble Forecasting System (GEFS, Version 10). This Reforecast V2 dataset consists of an 11-member ensemble of forecasts, produced every day from 00 UTC initial conditions from Dec 1984 to present. The horizontal resolution of GEFS is T254 (about 50 km) out to 8 days, and T190 (about 70 km) from 8-16 days. Real-time forecasts are ongoing.”

# Questions

- Was the low May-July 2017 seasonal precipitation predictable in advance of the season?
- Could the low May-July 2017 seasonal precipitation have been forecast at any lead time?
- What are the sources of May-July precipitation predictability?

# Little to No Tilt in Odds to Below Average Precipitation

(a) May-July 2017 NMME Precipitation Probability

(b) May-July 2017 AMIP Precipitation Probability

**Below Average**

**Near Average**

**Above Average**

40% 50% 60% 70% 80% 90% 100% 40% 50% 60% 70% 80% 90% 100% 40% 50% 60% 70% 80% 90% 100%

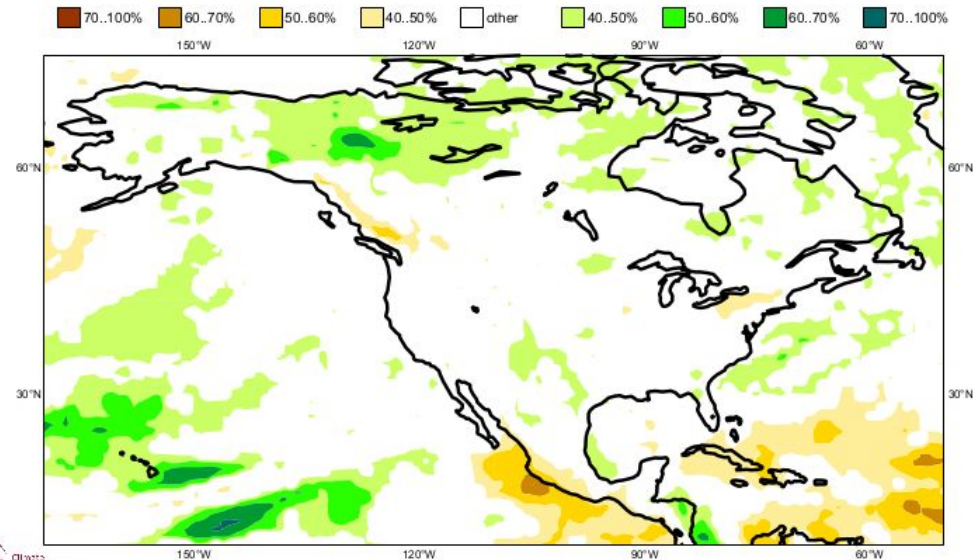

# C3S Seasonal Prediction System Initialized in April 2017

## Also Did Not Forecast a Shift in Odds to Below Average

C3S multi-system seasonal forecast  
Prob(most likely category of precipitation)  
Nominal forecast start: 01/04/17  
Unweighted mean

ECMWF/Met Office/Météo-France  
MJJ 2017

C3S is a multi-model ensemble comprised of ECMWF, Met Office and Meteo-France models

# Questions

- Was the low May-July 2017 seasonal precipitation predictable in advance of the season?

No

- Could the low May-July 2017 seasonal precipitation have been forecast at any lead time?
- What are the sources of May-July precipitation predictability?

# Dry Periods Predictable Up to 5 Days in Advance

- Dry periods forecast at short leads then model returns to its climatology
- One noteworthy daily miss in mid-June. Precipitation was over forecast.

# Dry Periods Predictable Up to 5 Days in Advance

- A sequence of 0-5 day predictions would allow one to forecast the dry evolution of the season.
- Beyond 1 week there is little indication of a dry seasonal evolution.

# Questions

- Was the low May-July 2017 seasonal precipitation predictable in advance of the season?

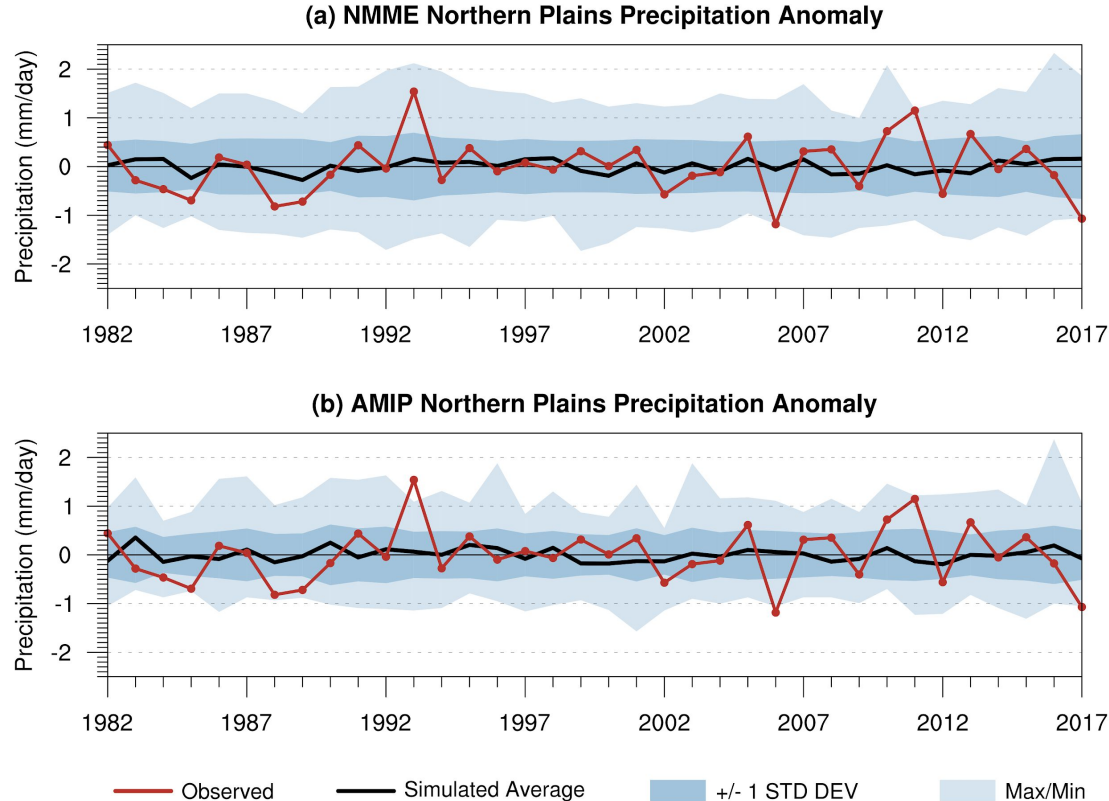

**No**

- Could the low May-July 2017 seasonal precipitation have been forecast at any lead time?

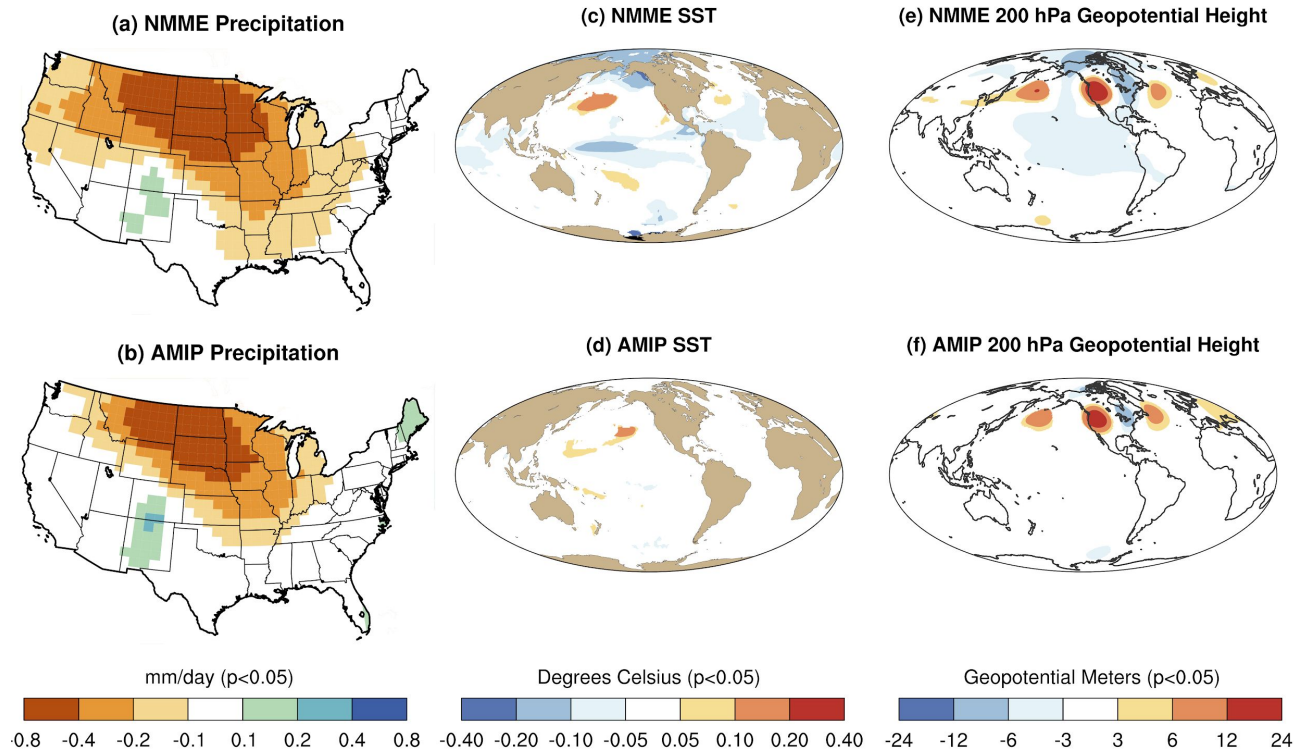

**Yes, through a sequence of up to 5 day forecasts**

- What are the sources of May-July precipitation predictability?

# Large Simulated Spread During All Years Compared to Mean Anomaly (Low Signal-to-Noise Ratio) Suggests Low Predictability Overall

# Low Precipitation (Weakly) Related with La Niña

Composites conditioned upon below average Northern Plains precipitation

# Questions

- Was the low May-July 2017 seasonal precipitation predictable in advance of the season?

**No**

- Could the low May-July 2017 seasonal precipitation have been forecast at any lead time?

**Yes, through a sequence of up to 5 day forecasts**

- What are the sources of May-July precipitation predictability?

**Mostly short lead times with a little long lead help by La Niña**

# Extra Slides

# No Tilt in Odds to Above Average Precipitation

(a) May-July 2011 NMME Precipitation Probability

(b) May-July 2011 AMIP Precipitation Probability

Percent of ensemble members that fall into the lower, middle and upper terciles of own model distribution 24

# Wet Periods Predictable Up to 5 Days in Advance

- Wet/dry periods forecast at short leads then model returns to its climatology

# Dry Periods Predictable Up to 5 Days in Advance

- A sequence of 0-5 day predictions would allow one to forecast the wet evolution of the season.
- Beyond 1 week there is little indication of a wet seasonal evolution.

# Northern Plains 20th and 21st Century Changes
